

Empiric reports

We again and again receive letters, in which the users of the unusual effect of the products report. Here an excerpt:

Grooming, reduce itching - Dog

PineFauna Skin and Coat Care Shampoo for Dogs - Great natural shampoo!

I love this shampoo. I use it on my show dogs a week or so before they show. Excellent for the skin and coat is simply radiant afterwards. PineFauna Shampoo does not strip the coat of oils and gently cleanses the coat without making it dry/flaky as many other shampoos are apt to do. It has a gentle pine scent, but this does fade after a couple of days. Great when used with the coat spray. You will find a VERY noticeable difference even after the first use. Coat will be shiny, gleaming, soft, rich, and pigment comes through well. Great for itchy and flaky skin as well when used with the gel.

PineFauna Skin and Coat Care Restorative Gel for Dogs - Great product for skin irritation and restorative for skin issues

This product is slightly different than the spray. I find it is better for skin issues and spot treatments. I have a rescue dog with skin issues.

She tends to break out in staph infections, gets red/inflamed ears, and develops lick granulomas during the rainy and allergy seasons. I have had great success with this gel and allergy medication. The gel soothes her ears, and prevents dirty buildup. The smell is pleasant and not offensive to the dog or me. I also use this product on her lick granulomas and areas where she has hair loss. It soothes the skin and reduces itching. I like to use this product on callused areas like elbow calluses. Good product and great value.

PineFauna Skin and Coat Care Spray for Dogs - Excellent product!

I show dogs and this is my go to product right before my dog enters the ring. Gives the coat incredible sheen, softness and richness. Brings out the color and pigment. Coat just shines like a diamond with this product. I can't say enough good things about this spray! It lasts a long time. Even with multiple dogs and weekly use, I still have quite a bit of the product left. The spray has a light, fragrant pine smell that is not overpowering. Absorbs quickly into the coat and does not leave the hair oily like some other heavier products. I use this spray for my allergic rescue dog as well - it helps with her itchy and flaky skin. Great product for dogs of all breeds.

Blood-covered rash in the fetlock areas - Billy goats

Dear Wilms Team,

Since the day I got them, one of my two miniature billy goats has been suffering from blood-covered rash in the fetlock areas – similar to mallenders for horses. During winter times it was never really particularly bad, but during the summer the claws always bled very heavily. The billy goat bit them open several times a day. The examination results of skin scrapings showed a persistent bacterium. Together with my veterinarian I tried everything, but even a treatment with a course of antibiotics over several months could not cope with this problem. Only, when we bathed the claws in a Camilla brew and then treated them with calendula ointment afterwards did I get a grip on the inflammation.

But it never disappeared completely.

In spring this year, within the space of a few weeks, I bought two 35kg bales of hygiene wood litter for spreading in the goat pen. Through an acquaintance of my mother's I had found your company and decided to start a last attempt in order to do something for the inflamed fetlocks. And I can tell you that my expectations were surpassed by far. Apart from a timely and absolutely unproblematic delivery of such an amount of litter, and apart from the pleasantly fresh smell, which was spreading in the pen, and apart from its absorbent properties, the fetlock areas of my little billy goat remained absolutely dry. Even during the hot period of time with temperatures of 38°C which is just behind us not the smallest spatter of blood could be detected.

When I think back to the last year.....in the summer, the rash was always extremely bad. Even during a warm period of time in December 2012 (14°C) the claws were sore. When I was ordering the second part of the delivery by telephone, I promised to take 'before-and-after' pictures. You will find them attached to this mail. On the one hand, there are photos of a (relatively mild) rash in a warm period in December 2012 at an ambient temperature of approx. 14°C, and on the other hand, of course, pictures of healed dry fetlocks in July 2013 taken during a hot spell with an average temperature of 37°C for more than 10 days. I am very pleased to put these pictures at your disposition so that they can be published on your homepage – after all, other customers ought to be given the chance not only to read about but also see the enormous difference hygiene wood litter makes.

My billy goat and I are absolutely happy with my discovery, and so is my veterinarian (even though he is a little hesitant to admit).

After all those unsuccessful therapies I would never have imagined that the hygiene wood litter would really make a difference, let alone this 180 degree turn.

I am absolutely convinced of this product. In future, there will be only this litter in the goat pen. That is 100% sure.

Many thanks for this fantastic product.

Kind regards

Lisa Kaufmann (18) – your new regular customer!!!

Pine heartwood extract against parasites on koi carps

We use the pine heartwood extract very successfully in his koi pond. The fish (Japanese koi – 12 fish between 30 cm and 80 cm long) always used to have parasites in their gills. They were treated with tablets against worms but did not really recover a 100% after the treatment. →

Again and again the fish had worms in their gills. After using the extract there are not any complaints any more. An enormous difference compared with earlier on. The veterinarian's conclusion: water parameters good, no parasites detectable, everything is OK.

As far as the dosage is concerned: after changing the water in spring and autumn use 5 litres of the extract for the 6 cubic metres of water (two thirds of the water had been exchanged before – the treatment the treatment with Wilms care extract).

Many thanks for that.

Sandro Schnarwiler

Insect protection , ear cleaner- Dog

Great products

I love the PineFauna products - we have show dogs and in Summer the flies bother them in the ring and so I use the spray and a repellent.

I also use the spray as an ear cleaner for all of my dogs and so far perfect results. These are great products that any dog owner would

find very useful.

cscott

Grooming - Cat, Skin eczema , Parasitic infestations - Bird

Tierhilfe (Animal Aid) Melle e.V. – our experience with Wilms PinusFauna products

We regularly use Wilms PinusFauna products in our animal care. Our cats have shiny and well-groomed coats. PinusFauna Spray quickly regulates the natural balance, in particular after the regular treatments against vermin, when the skin is irritated. Our deaf tomcat Ronny suffered from a strong allergy against flea excrements. He got so quickly bald in the pelvic region that we had to treat him massively and radically with potent drugs. Afterwards, his skin was extremely damaged. We sprayed him with the wood spray and could see the healthy hair grow again. Today he sports a full and shiny coat again. We treat animals with skin eczema with the gel, because it is easier to rub into the skin.

Our birds are regularly sprayed, and so are our high perches and everything that is made of wood within the aviary.

Our St Lucia Amazon had always plucked herself and was almost bald on the belly. Sprayed regularly she now has a full and beautiful plumage. It is really not possible to forget to spray, because you would notice immediately, when you see the animals.

Our rose-ringed parakeet had a completely bald head, when he came to us. His head was scabbed and he could hardly see – acute mite infestation. The head region is of course difficult to treat with chemicals. We sprayed the bird, including the head region, until he was soaking wet. The very next day you could see that the animal was feeling much better, and after a couple of days the first feathers appeared on his head. Our birds are additionally fed PinusFauna as their drinking water in order to reduce parasitic infestations.

Kind regards

Gabi Lampe

Grooming - Dog

I have been recently trying to find a shampoo that will help my dog's coat shine. I have discovered anything you get in the grocery store, big pet stores or walmart is mostly crap. I just ordered this product after a friend recommended it and I haven't seen better results with any past products. After bathing my boxer with PineFauna I already noticed a difference in his coat. Now that I am using it regularly he has an amazingly shiny coat. He also had a few spots with hair loss due to allergies, but I noticed regrowth in hair after only a week. I didn't do too much research on the product before purchasing but I discovered its all natural. I would recommend this to family and friends, or anyone with a dog. I would also check out.

Travis

Grooming - Dog

I have only recently come into PineFauna products but I am already in love. I have a Boxer puppy who has had chronic allergies and had 3 nickel to quarter sized bald patches on his body. Within two weeks of using just the gel I noticed baby fuzz growing back but I wasn't seeing the real results I wanted so I called the lady who told me about the products and she gave me a regimen to follow. She suggested that I shampoo once a week, use the spray 2-3 times daily and after spraying, apply the gel 2-3 times daily as well. This seemed to jump start regrowth and in a few weeks I believe we will have all our hair back. I would recommend this product to anyone..... They have made my puppys coat glow!!

Amy McCurdy

Insect repellent (fleas & flies) - Dog

Great Product

I use the entire line of PineFauna products. I use the spray the most for insect repellent (fleas & flies). We holistically treat for fleas and once or twice a year have them showing up depending on the weather. I use the spray to repel - it works so well in fact that I had prior just sprayed the backs of the dogs, to find that the fleas avoided the top and hid on the belly! We now spray while camping. I use the gel for hotspots. Great product that I am glad to have on hand.

Melissa K. Pevy

Grass mites allergy - Dog

Hello dear Wilms Team

Finally the time has come that I'll just have to praise you greatly.

I have had Coton de Tuléars for more than 14 years. Right from the beginning I have had problems with autumn grass mites in late summer. My dogs had them between their claws, at the ears and navel and were afflicted by them with itching for roundabout 6 – 8 weeks. Licking for hours did not help either.

Due to the application of dog shampoo and PinusVital spray, the tiny pests are like suddenly wiped out. First I thought there were no autumn grass mites this year, but as I had not yet bathed one bitch, I very quickly realized that she was still infested with these bugs. I immediately shampooed her and she had her peace and quiet at once, and the itching disappeared right away, too. Previously, I had been to the veterinarian's because of this, but unfortunately he had not been able to help my dogs.

I cannot but highly recommend your products and will tell every dog owner about them.

By the way, I did completely without chemical Spot-ons this year. Thanks to your shampoo, my dogs have no fleas, and only occasionally is there a tick on the dog fur after going walkies, which I quickly remove.

Many thanks, Company Wilms.

Kind regards from Bavaria

Brigitte Kuchler

Insect repellent , injury - Horse

Pine Fauna Skin & Coat Care Gel

I have been using Pine Fauna Spray and Gel for the past six weeks on my gelding to repel the insects that swarm at sundown, especially the nasty little bugs we call no-se-ums, similar to gnats. They really dislike the smell of it. As a result, he is growing out his beautiful tail which was rubbed to bits last year. I use the Pine Fauna Gel for any injury that occurs to one of our horses in the barn and I have had wonderful success with it. Bites from other equines fade away, leaving no trace of scarring, and the hair grows back in quickly. Kicks, scrapes, lacerations, tears, and whatever else one could think of that did not require immediate veterinary repair have all responded beautifully to the gel. Now everyone in the barn is using it. Every horse and dog owner should always have plenty of both the Pine Fauna Spray and the Gel readily available.

Sherry M Zendel

Ear cleanerhot spots - Dog

Pine Fauna Skin & Coat Care Gel

I have used Pine Fauna Spray on my dogs for the past year. I have three Golden Retrievers who love the water, and I found that the spray keeps their ears fresh and clean, and most importantly free of the yeast infections that are so prevalent in a moist environment. I also use the Pine Fauna Spray and Pine Fauna Gel on hot spots and lick granulomas with wonderful results. Every dog owner should always have plenty of both the Pine Fauna Spray and the Gel readily available.

Sherry M Zendel

Injuries, hoof care - Dog

PineFauna Skin and Coat Care Restorative Gel for Dogs

My 30 year old mare bumped her ankle on the exact location of a very old scar. It opened up with the flesh separated. After washing the wound every other day with PineFauna Shampoo to clean the wound and using PineFauna Gel, I noticed the wound was closing. She was walking without pain and the wound bending with every step. When only a small amount of drainage remained, PineFauna Spray was just perfect to get to that last little spot as her hair was growing back in that area. In just a few days the wound closed up completely. The area now has a reduced scar from using PineFauna, and if the product had been available when she was first injured years ago, she probably would have never had a scar. I also use PineFauna Spray on the soles of my horses' hooves to kill bacteria and for many other horse needs. I am so glad I discovered these great products!

Brenda Lovett

Itching & open sores - Cat

I would like to just briefly tell you that your care extract PinusFauna, which I ordered from you, really worked wonders with our cat. After just two weeks all the open sores had disappeared and the itching had disappeared completely. Now, we have a healthy cat again.

Kind regards

Herr K. from Roth

Skin problems - Horse & Horse

Pine Fauna WOW

Pine Fauna shampoo and gel has provided great results for skin problems for horses and dogs. The product is effective for general cleaning of skin, wounds and irritation. The improved skin condition is noticeable after the first use of Pine Fauna. The Pine Fauna Spray is used when a quick refresher or spot treatment of coat. I have found the spray to be effective in gnat control for dogs and horses with a fresh non-chemical aroma. The gel is used for wounds to prevent infection and promote healing naturally. This product is very good to have for first aid and daily grooming.

I LOVE PINE FAUNA WOW.

Brenda Lovett

Chafed skin areas- Horse

I have been using PinusFauna care extract to treat chafed skin areas of my "summer mange horse" for three years. Since I started using the watery wood extract, the skin areas have been healing fast and the itching has been alleviated.

Kind regards

Juliane Erdmann

Shed - Horse

We saw the report on TV, in the ZDF Auslandsjournal (Foreign Affairs Journal). That was great promotion for the shampoo, indeed.

I tried this natural shampoo right away on one of our boarded mares. During changes of coat, she always had severe skin problems. Her entire back was full with scales, which just would not disappear however hard we tried. The mare is 25 years old and up to now we haven't found anything that helps against these scales.

But..... First all the scales disappeared from the back and then there was a shine on her coat. The horse looked like shimmering copper in the sun.

Absolutely brilliant.

Best wishes from *Kauber Platte*.

Melanoma - Horse

In the pictures you can see so-called melanoma (skin tumours), which normally occur with white horses only. These skin tumours can also turn malignant. The gene alteration is a so-called regulatory mutation.

The first horse had already been treated with Wilms®PinusFauna care extract and Wilms®PinusFauna care gel 2 months before its first admission in April 2009.

The tumour was as big as a fir cone. I submitted the white horse to a normal SMT (soft/gentle manual therapy) treatment and daily rubbed it exclusively with Wilms®PinusFauna care extract and Wilms®PinusFauna care gel. →

In August 2011, the second horse was also treated with SMT (soft/gentle manual treatment). The horse was also sprayed with PinusFauna care extract from time to time. I also used Wilms®PinusFauna care gel time and again, but nothing else. Due to PinusFauna care extract and Wilms®PinusFauna care gel, the spot under the belly did not develop into an inflammation. Also, this big tumour was healed after a certain time.

Wilms®PinusFauna care extract and Wilms®PinusFauna care gel seem to be panaceas, if they can heal such bad skin tumours.

Thanks to Herr Wilms who continues to further develop these products .

And also a huge thank you from the horse owners.

Willi Wendland

holon Product test

In summer 2011, we tested the animal care product Pine Fauna . The test was carried out via the holon Forum in cooperation with company Wilms.

In general, holon is not willing nor prepared to test industrial care products. We are making an exception here, because the product contains just one active agent – pine heartwood extract. That corresponds to the homeopathic approach.

Horse / Donkey

Sweet itch

The healing of wounds and skin irritations is accelerated by Pine. It does not have an effect on the disease itself (which is hardly surprising, as sweet itch is not caused by pathogens).

Problems at the feathering (itching, scales, scabs)

In one case, where Pine Fauna was sprayed once a day, the medical condition disappeared within three weeks. With mallenders there are diverse experiences, a very positive one as well as one without any improvement.

Lengthy sore patches from chafing

Very good experience when consistently applied every day. Patches heal completely, if the animal has no psychic reasons to chafe itself again and again (boredom, stress, box stabling etc.).

Biting lice

Biting lice in the spring could be drastically reduced by thoroughly spraying infested skin patches with Pine Fauna. Brushes were also sprayed with Pine after grooming and left in the sunshine for drying.

Protection from insects

Flying insects can be kept away by Pine Fauna for a short while only. Pine Gel on the wounds of grazing livestock protects very well against flies for some hours (and consequently maggots).

Climate in the stable

Some horse owners proceeded to spray Pine Fauna in the stable in the summer after mucking out. The air is good, the number of flies is reduced temporarily and horses like going into the stable again. →

Dog

Skin irritations of unclear origin: Pine increased erythema and pruritus. Probably an allergic reaction.

Moist, itching patches in skin folds after bathing and slow drying. Patches heal with the help of Pine, and are not newly formed, when Pine is consistently applied after each bathing.

Chronic flews eczema

Cocker Spaniel with chronic flews eczema. Despite surgical tightening of chin and flews areas, food residues continued to stick to these areas and caused flews eczema within a couple of days, although the skin was thoroughly cleaned with water. So far, that always necessitated a treatment with antibiotics (approx. every 2 – 3 weeks). After a moderately successful attempt with calendula solution, we also tried Pine and cleaned with it every day. The caring effect of Pine seems to have a positive effect on the skin. Up to now, no further treatment with antibiotics has been necessary (follow-up period approximately 2.5 months).

Hotspot

Here, Pine almost represents a revolution. Hotspots are deep, weeping, bacterial skin inflammations, which spread circularly. They are painful and highly itching. If sprayed with Pine Fauna, they heal incredibly fast. Numerous treatments of a range of dogs clearly demonstrated that.

Ear infections (because of bacteria, mites, Malassezia)

Pine is well suited to soothe the medical condition by cleaning with Pine-soaked compresses. Naturally, Pine cannot heal the cause of the disease (immunodeficiency, improper feeding practice).

Ticks

A dog, which had previously reacted with severe local inflammations and swellings. After removing more ticks, the spot was immediately sprayed with Pine and the inflammations failed to materialize.

Cat

Ohrmilben

If there is an infestation with **ear mites**, Pine just soothes the itching and helps clean the outer ear. For a healing process, a recovery of the immune system is needed. The same is true for **Malassezia**.

Pine helps accelerate the healing of individual skin patches of cats, which are bald and sore through continuous licking. As the reason for licking is not due to infections (cats usually produce bald patches by licking because of stress) Pine cannot heal the disease itself.

General

Pine accelerates comfortable healing of small wounds and abrasions.

Pine soothes acute trouble such as burning and itching in the event of local contact allergies.

Bruises caused by harness, leader headcollars etc. quickly heal with the help of Pine. →

Accompanying experience through human self-experiments:

Insect bites

Cools, sustainably soothes itching (several experience reports)

Pine Fauna Gel

There were two cases of donkeys, in which Pine-Gel was applied in order to also soften the affected patches up a little. A tail root, chafed down to the raw flesh, healed completely after two applications of Pine-Gel without any further treatment. A naturally opened abscess, which was not to dry but to stay dischargeable, healed without complications within a few days, after Pine-Gel had been generously applied twice a day. Secretion could seep out, there was no closure through dried secretion and, above all, flies were kept away.

Our application recommendations

Pine Fauna can heal bacterial skin infections. It accelerates healing of wounds. It soothes itching and burning. However, Pine cannot heal chronic diseases such as sweet itch, allergies, or psychic stress, as can no other externally applied care product. It helps, however, to alleviate troubles associated with these diseases.

As two cases of deterioration after the application of Pine were reported, we recommend (as we do with every care product that is externally applied) using a small quantity of Pine on a healthy skin patch and looking for erythema after a few hours.

Brushes and combs can be sprayed with Pine after application and rough cleaning to keep them in a more hygienic status. They should, however, be dried fast and completely (sun, heat source).

Eyecare - Dog

Dear Wilms Team

Today, I would like to give you a short update on our application of the wonderful Pinus Fauna products. ...

Irritated eyes get quickly bright and clear again, when a cotton wool pad soaked in PineFauna...

I am very satisfied with this result and will continue to report on our application of Pinus Fauna products.

Many greetings

Sabine van Wel

Schlittenhunde Schule, Hundebedarf

Hairless spots - Rabbit

I treated my Red New Zealand rabbits with PineFauna Restorative Gel. They had hairless spots on the neck. Already after five days they showed a considerable growth of hair. I am really surprised of the outstanding effectiveness of the Restorative Gel and will inform other breeders about my very positive experiences..

Siegfried Mindrup, Osnabrück

Eczemas between the paw pads - Dog

At the Horse Fair in Fn my attention was drawn to Wilms's Pine Fauna care extract, and I have treated my allergic dog with it ever since. My German shepherd dog suffers from eczemas between the paw pads and is allergic to mites. I am very satisfied with the care extract, as significant improvements became evident within 24 hours after spraying.

Kind regards *Dagmar Göbel*

Sweet Itch - Horse

A very good day to you,

I have some feedback relating to your new product Wilms Pine Fauna care extract: it truly is a real panacea.

I have a pony, which has been suffering from sweet itch for many years. I have tried a great many products, but have never been as successful as I have been with this spray. After spraying the crest, you can immediately see that the itch is vanishing, because the pony stands there absolutely relaxed enjoying the relief. Furthermore you can see fantastic wound healing at the chafed area of skin. Scab just comes off and the skin underneath looks very good. And you don't have to spray several times a day, because I was absolutely successful when I used it irregularly. Whenever I go to the horse pasture I spray, so not more than once a day.

Kind regards *S.M.*

Scar formation - Horse

I want to contribute a progress report, too.

We use Pine Fauna as a spray, as well as your carrot pellets and beetroot.

Last summer I bought a warm blood which is seventeen years old by now. I bought him for little money, as he limped and was actually meant to be slaughtered. I had him examined. Diagnosis: arthrosis in the forelimb. He got hyaluronic acid injections. The condition improved slightly. Additionally he got rampion and ginger (both in ground form).

As he would not eat it in its pure form, I soak carrot pellets and beetroot and mix everything. He hardly limps anymore. Looks great and behaves like a spring chicken.

When I bought him, he had firm scars on the posterior inner fetlocks. Each one as large as half a palm. He also had bald scarred spots at the withers.

And then I came up with the idea of spraying these areas with Pine Fauna. Just look and wait what is going to happen. It was not even one week, before the old scarred layers began to come loose at the edge. When one area came off altogether, I was shocked at how thick this bald scarred 'bark' was. It was 4.5 cm thick. We decided to continue spraying him. I am really curious as to how this will develop; how the skin will develop now; if these areas will recover and if hair will possibly grow again.

I will get back to you on that via mail.

Kind regards *Britta Feldmann*

Malanders and eczemas in transversal skin furrows - Horse

Dear Team,

In October 2003, I bought an almost white tinker gelding with blue eyes from England. Then, the horse was three years old and passed the antibody tests with no findings.

After a settling in period of four weeks, minor ailments, so typical of tinkers, such as eczemas in transversal skin furrows and malanders started. →

These were subsequently treated by a veterinarian. Since then, we have always made sure that James does not stand in the mud and also tried to fight eczemas in transversal skin furrows and malanders with various methods. Sometimes successfully, sometimes unsuccessfully.

Over the years, the vet bills added up and nothing really helped.

I have really tried everything. Starting with autohemotherapy, laser irradiation (which had a terrific effect, but is unaffordable in the long run), expensive vaccinations against fungi, special feed, allergy testing, cortisone treatment, alternative treatment methods such as homeopathy and Quantum Entrainment. However, none of these resulted in sustainable improvement.

The problem with chemical mazes was that they caused allergic reactions in my tinker. It has to be added that James is almost as sensitive as an albino.

The worst thing with this kind of affliction was the itching and smarting, which made James very dissatisfied. The money, which I spent on various treatments over the years, would surely have been enough to buy myself a second James.

At some point, employees of the Olewo company approached me and gave me a sample of the newly developed Pine Fauna gel and asked me to try it.

Well, I thought: will not do any harm. It's worth a try. I did not have a great deal of hope, though. So, I took the sample and tried it on my James. I shortened my tinker's coat, in order to better access the infested areas. Then I applied Pine oil without any sophisticated pre-treatment, such as washing and things like that.

After three days only (I did not dare trust my eyes), a significant improvement became evident. The malanders infested areas were already dry, and James's itching caused by malanders and eczemas in transversal skin furrows had been reduced by 80% after one week. Since then I have been applying this panacea, as I would call it, on a daily basis in order to prevent another outbreak.

I would have liked to have had this stuff earlier. This would have saved my horse a lot of suffering and I would have saved a lot of money. But the best part of this gel is: it is purely plant-based and can therefore be used without hesitation. I cannot but recommend to any horse owner, whose horse has skin problems of whatever description, using Pine Fauna gel. They, who do not trust this, just have to try it.

A friend of mine told me that Pine Fauna even helped with the eczemas of her pony.

Only they who try will find out.

Best regards James *Jérôme Boechat* with James

Scale formation - Horse

Dear Sir or Madam

As a 'Thank you present' for my last progress report (equine sarcoid), you sent me a little bottle of the above mentioned extract.

During change of coat, my 14 year old thoroughbred English mare is prone to strong scale formation in the chest area and on the cannon bones. Brushing, washing, tea-tree oil lotion – so far, everything has been relatively unsuccessful. Then I got the little bottle and thought by myself 'Won't do any harm.' And, well, it didn't – just the opposite.

After applying it just twice within four days, the scales have virtually disappeared. The coat is smooth and sleek and she enjoys being brushed in those areas again, which clearly displeased her in the past.

Thank you very much indeed for this product, too

Nancy Franke, „Authentische Kommunikation“

Rhinorrhea - Horse

Dear Wilms Team

Amat (Arabian mare), born May 17, 2003

Amat came from Egypt to Germany when she was 3 years old. Already in Egypt did she suffer from chronic purulent nasal discharge, for more than five years, all in all, with constantly changing or overlapping germs respectively. She was treated with the relevant antibiotics, which caused the discharge to stop for a couple of weeks or reoccur immediately.

Due to a change of stable Amat has had new climatic conditions and a different kind of food since June 2010.

She had had continuous purulent discharge since February 2010.

An examination in Hochmoor Clinic showed no pathological changes of the frontal sinus cavity, where mucus had settled at a constant level. She had neither lung problems nor anomalies of the skull.

A nasal swab showed a moderate content of *Pseudomonas fluorescens*, *Streptococcus equi* subsp. *equi*. The corresponding antibiotics, however, did not have any effect. A second nasal swab showed a small share of strangles bacteria. But she neither had a temperature nor any other symptoms typical of strangles.

Frau Moritz und Herr Baumann from Kauberplatte had reported on a similar case in the past, which they managed to get under control with the help of inhalations. Frau Moritz recommended Pine Fauna as inhalant, as it had proved very satisfactory in her experience.

Thus, the course of antibiotics, which had already been started, was additionally supported by inhaling Pine Fauna and resistance enhancing food (Olewo beetroot).

After finishing the course of antibiotics we continued using Pine Fauna 3 to 4 times a week for 2 months. The last inhalation was at the beginning of December 2010 and so far (January 19, 2011) no nasal discharge has occurred.

The inhalation of Pine Fauna was very soothing and relaxing for Amat. The individual inhalation lasted for approx. half an hour to three quarters of an hour. We will prophylactically resume inhalations at the beginning of March, or immediately when nasal discharge reoccurs.

My personal impression is that Pine Fauna played an important role within this therapy. It was well accepted by Amat, once she had got used to the inhaler.

In addition to her food Amat is fed Olewo beetroot chips every day. This practice will be continued further on. Thanks to Olewo chips and Pine Fauna, she has been free from nasal discharge and thoroughly healthy to this very day (May 2011).

Best regards from Kauber Platte *Reinhild Moritz*

Drinking water and bath water - Pigeons, Ear infection - German shepherd dog

Dear Herr Rauer, just some information on my experience with Kieferngold. We have been successfully using Company Wilms' Kieferngold with our racing pigeons since 2005. We travel as sports group (SG) Schröder in the travel association (RV) Limberg in the Regional Federation 256 Osnabrück. Our pigeons are given Kieferngold as a drinking water supplement as well as in their bath water. As I know that pigeons usually do not like supplements in their drinking water, I carried out the following long-term test. For a fortnight the pigeons got clear water in a white drinking trough, then for a fortnight drinking water with Kieferngold in a brown drinking trough. That was carried out on an alternating basis a couple of times. After the animals had learned that the brown drinking trough always contained Kieferngold and the white one always clear water, I gave them both drinking troughs for them to select their favourite. →

The following day I exactly measured the remaining quantities. To be completely on the safe side I changed the position of the white and brown troughs respectively several times. The result of the field tests shows that the pigeons drank significantly more water from the brown drinking trough (with Kieferngold) than from the white one (clear water). As the animals are much more intelligent than we suspect, it can be assumed that Kieferngold has a positive influence. Otherwise the pigeons would have preferred clear water when given a free choice.

Our German shepherd dog Gorbi, too, gets Kieferngold on a daily basis. He used to have problems with his ears (typical of German shepherd dogs). When we tried for the third time, he refused to have drops of the veterinarian given drug put into his ears. Another drug, administered in the feed, helped only the veterinarian again. Then I came up with the idea to spray Kieferngold into the dog's ears. At first, the dog did not want to let me treat him, but soon he realised that Kieferngold does help him. Now, I just have to say "Gorbi, give ear" and he readily offers his ears.

I do hope that this experience may be beneficial to other animal lovers, too.

Best regards *Gerd-Heiner Schröder*

Skin irritation - Horse, Ear infection - Dog

At the State Horticultural Show in Bad Essen we were introduced to the products of Company Wilms.

We very successfully used the product Wilms Pine Fauna with our horses.

Skin irritations disappeared completely after 2 to 3 days.

Inflammatory processes in the inner ear of our dog also abated.

One easily talks about "miracle cures", but you'll wonder how fast this cure works.

We are determined to test further products.

Many thanks *Klaus-Uwe Grützmann*

Drinking additive - Pigeons

Dear Wilms Team

I am a breeder of racing pigeons and use Pine FAUNA for my pigeons. Professional proximity to Company Wilms enabled me to use Pine Fauna over a longer period of time. A daily dosage in diluted form keeps pigeons in a generally healthy condition without the employment of chemistry. Therefore, young pigeons in their nest already get Pine Fauna, which leads to the development of a healthy immune system, and can also be seen in the excellent condition of their excrements. I am convinced of the effectiveness and cannot but recommend it.

Regards *Ulrich Kuhlmann*

Flea-instructed - Cat

Dear Wilms Team

Your extract helped us prevent the employment of cortisone for the treatment of our daughter's neurodermatitis. It seems that the skin has recovered almost 100%. Our daughter can now even go to the outdoor saltwater pool again. That used to be impossible because of her "open" skin.

We used the extract, intended for the use with animals, against fleas on our new cat the other day. As the procedure took place in the washbasin, we could watch the little pests leave the animal in a "hasty escape".

We are enthusiastic about the effect.

Kind regards *Frau Müller.*

Injury und thrush - Horse

Hello

We would like to express our heartfelt thanks for all your efforts. Your advice and horse-sense has greatly helped us. We have applied PineFauna to our horses and are absolutely thrilled that this natural means has healed them so quickly and impressively. The older gelding's girth injury has been completely healed and hair has grown again. We got the thrush under control, too. We also had the saddle for the three-year-old gelding re-upholstered according to your specifications and massaged the saddle position every day with your pine heartwood extract. After a few days already, new hair had grown. We followed your instructions as to lunging and breaking in, and can ride the horse in the country in company. We are happy to have met you at the State Horticultural Show in Bad Essen. We will continue to apply Pine Fauna and naturally recommend it. By the way, we sprayed ourselves with it and thus averted the annoying insect bites. Many thanks again for your friendly and convincing advice.

Kind regards from Mastholte

Yours *Family Köhler*

Tick bite - Dog

Dear Sir or Madam

Many thanks for your message. I would like to add my experience with my Shorthair bitch's tick bites. If the place of puncture is treated with PineFauna after removal of the tick, it will not show any reddening or swelling. Moreover, I found out that mosquitoes will not attack me during my garden work, when I have sprayed my arms. PineFauna – good for animals and humans!

Kind regards *Annette Steube-Lehmann*

Fungal infestation - Guinea pigs

Dear HygienicWood Team

Again and again, my new seeding was destroyed by a fungus. After a short while, the little plants became mushy and collapsed. Now I spray them with PineFloris and also water them with it from time to time. All seedlings show fantastic growth and no signs of illnesses. This is what I will always do from now on.

Our guinea pigs, too, were infested with a mycosis (fungus). Hair fell out in some places. We simply filled PineFauna in a little spray bottle and sprayed the animals every day with it. Now the fungi-infested areas have disappeared, and fur is growing again. As guinea pigs are particularly sensitive animals, this is a great success. I am really thrilled.

Best regards *Susanne Berkemeyer* from Bad Essen

Tick prevention and dermatophyte - Dog

Dear HygienicWood Team

I have been using PineFauna spray with my two dogs for a couple of weeks. And I must say I am absolutely enthusiastic. It is not only a care product, but also keeps the major part of pests away. I am not a fan of chemical tick products at all, and therefore followed a tip and tried PineFauna. Thus, the tick infestation of my dogs decreased to a minimum. My dogs are also widely protected from annoying mosquitoes and other pests now. Just spray briefly before each walk and there you are. The dogs are not bothered by the spray at all. With the support of PineFauna, I also managed to get a grip on the skin fungus of my bitch fairly quickly. Recommendable in any case.

Regards *Katharina Karow*

Problems with its plumage - St Lucia Amazon, dull coats and irritated skin or itching - Dog

Hello dear HygienicWood Team

Meanwhile we have tested many products and are convinced. At the beginning the toothpaste takes some getting used to with regard to colour and taste, but it is really good for teeth and gums. The sleeping mat is too hard for my husband, I sleep very well on it. But the best of all is PineFauna. We sprayed our St Lucia Amazon with it. The bird had had problems with its plumage for almost a year. The breast was covered with just grey down. We had changed the food, treated it for mites, nothing helped. Then we sprayed it with PineFauna and only a week later it looked, as if the quills would break open. The plumage followed so quickly, it was hard to believe. I will send you some "Before – after photos".

We now regularly spray our parrots and also cats and dogs with dull coats and irritated skin or itching. The spray also helps very well against small burns. Thus, blisters do not even develop.

Infestations with biting lice and mites - Guinea pig

Dear HygienicWood Team

When my eight guinea pigs suffered from infestations with biting lice and mites at the same time, and had scratched themselves almost unconscious despite compounds from the veterinarian (extreme itching can actually make them suffer a comatose shock, which can be potentially fatal), I tried the pine spray...after only two applications in the morning and evening it got already much better. After two more days the itching stopped almost completely. SUPER! My guineas say: MANY THANKS!

B.Raabe

PS: My special thanks go to Elke Adam. That was a super tip :-)

Ekzem precaution - Horse

Dear Herr Bösmann

The black flies time is over, our two ponies 'breathe again'.

Both horses survived the summertime better than the previous year, when we tried to fight the sweet itch with oils. They did not get any bald patches. The itching was obviously reduced so that they did not rub their fur so vehemently. I am very happy about that, and would consequently like to already order 5 more litres for next year.

Kind regards *M-Th. Zilling*

Your product Pine Fauna has convinced us. We actually bought it for our horse, but now the whole family is using it for skin problems. It's a sweeping success!

Thank you very much! *Kirsten Perk!*

Case of summer - Horse

Hello!

Last year I cared for my horse using the PineFauna extract because she had a very bad case of summer eczema. I am highly satisfied with your product. I had previously tried combating summer eczema with other products, but your pine heartwood extract has brought far better results.

Sincerely, *Lewandowski*

Summer eczema - Horse

Hello Mr. Wilms!

Just wanted to share some positive comments...

... on my horse against basic tail itch and it works! It even immediately took away the itch of a horse with summer eczema!

I am very excited and happy to recommend it!

Frau Böse ■
